

INTRODUCTION TO STATISTICS

Slides by

Pierre Dragicevic

WHAT YOU WILL LEARN

Statistical
theory

Applied
statistics

This lecture

GOALS

- Learn basic intuitions and terminology
- Perform basic statistical inference with R
- Focus on high-level aspects
- Accent on estimation rather than hypothesis testing ("the New Statistics")

ORGANIZATION

- Part I - Elementary notions
- Part II - Tutorial with R
- Part III - Assignments

A DEFINITION

Statistics is the study of the collection, analysis, interpretation, presentation and organization of data.

Dodge, Y. (2006) The Oxford Dictionary of Statistical Terms, OUP.

ORIGINS

- 1750s German Statistik
“analysis of data about the state”
- Quickly adopted in England
(previously called “*political arithmetics*”)

Achenwall, Gottfried: Abriß der neuesten Staatswissenschaft der vornehmsten Europäischen Reiche und Republicken. Göttingen, 1749

ORIGINS

John Graunt, 1662 *Observations on the bills of mortality*

CAPTAIN JOHN GRAUNT

THE TABLE OF CASUALTIES.

ORIGINS

John Graunt, 1662

Observations on the bills of mortality

- First “life tables”
- Dispelled several myths about the plague
- First analysis of sex ratio
- First realistic estimate of the population in London

ORIGINS

- Prompted collection of more data
- Parallel developments in probability theory
- Statistics then developed into a more rigorous discipline and was applied to:
 - Business & industry
 - Medicine
 - Science
 - ...

STATS & VISUALIZATION

Statistical Charts – William Playfair 1759 – 1823

STATS & VISUALIZATION

Exploratory Data Analysis – Tukey, 1977

Box-and-whisker plots with end values identified

A) HEIGHTS of 50 STATES

B) HEIGHTS of 219 VOLCANOS

Figure 5.14 Generalized draftsman's display of the four-dimensional iris data (like Figure 5.11), with one flower plotted as an asterisk.

Statistical Graphics

– AT&T Bell Labs Video, 1985

Baby Name > ✕

Both Boys Girls

2009 rank: boys

1000	500	100	25	1
------	-----	-----	----	---

girls

1000	500	100	25	1
------	-----	-----	----	---

Names starting with 'CR' per million babies

Last letter of boys' names in 1950

Last letter of boys' names in 2010

46 64 54 77 67 68 62 56 38 Population
N = 9

Random

Sample

n = 4

38 62 67 62

$$\bar{X} = \frac{\sum x}{n} = \frac{229}{4} = 57.25$$

The mean of this Random Sample equals 57.25 (i.e. $\bar{X} = 57.25$)

$$\mu_x = \frac{\sum x}{N} = \frac{532}{9} = 59.11$$

The Mean of this Population (μ_x) equals 59.11 (i.e. $\mu_x = 59.11$)

The Central Limit Theorem tells us that \bar{X} is an unbiased estimate of μ_x . (i.e. $\bar{X} \rightarrow \mu_x$)

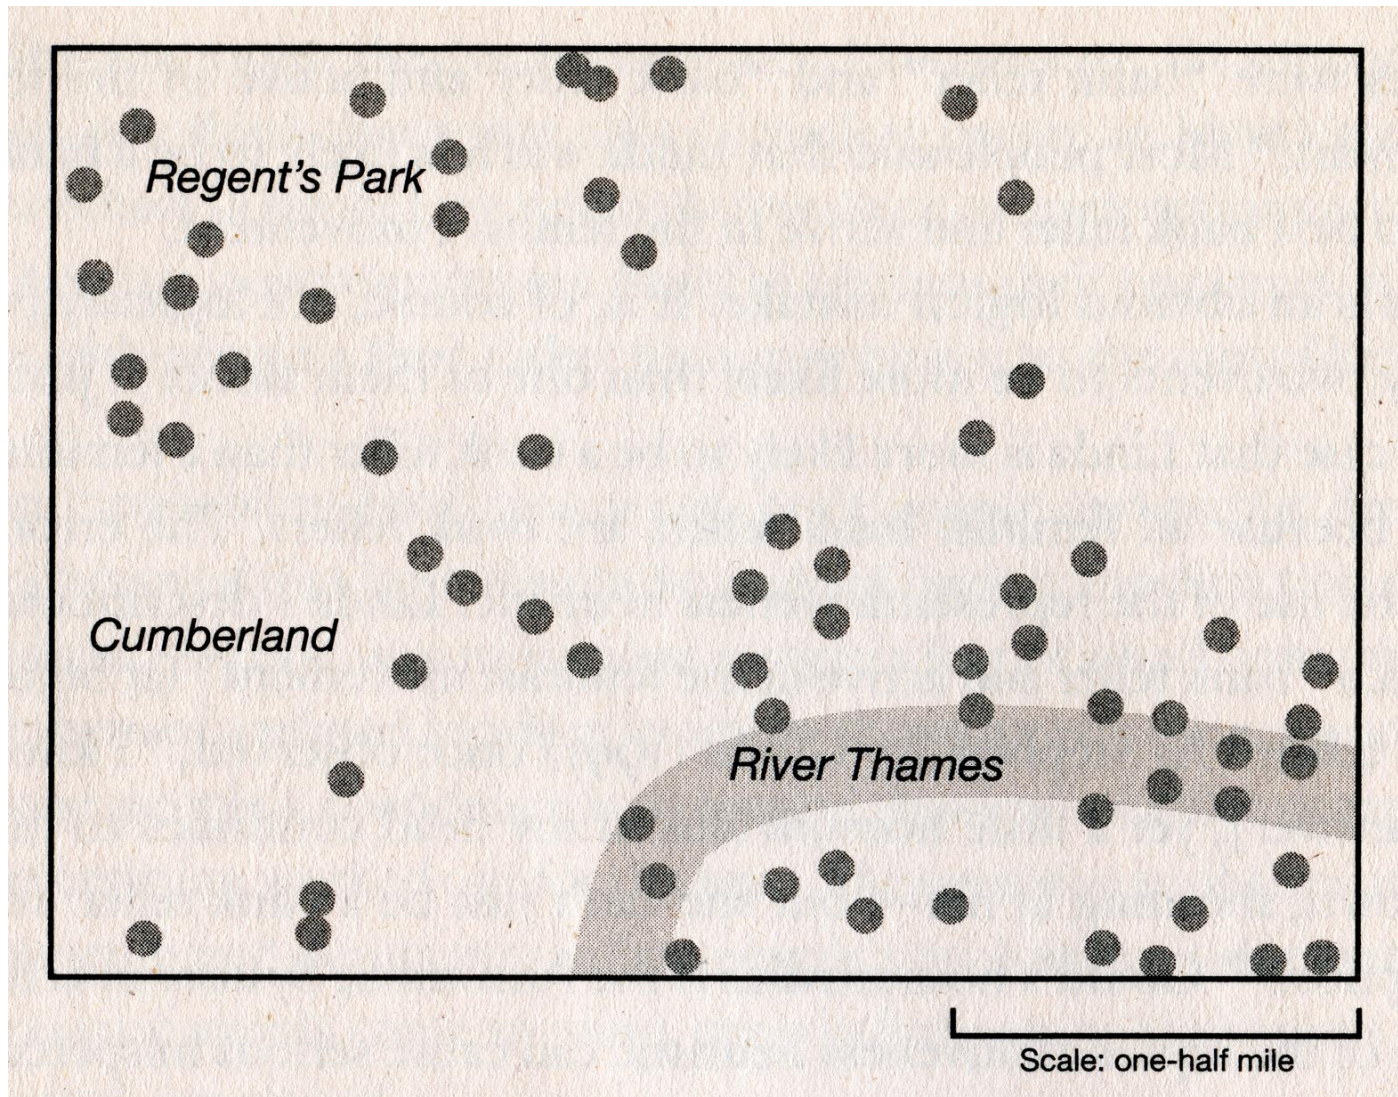

In short, with only one random sample to go on, the mean of the sample ($\bar{X} = 57.25$) is our best estimate of the population mean (μ_x)

German bombings in London during WWII

German bombings in London during WWII

German bombings in London during WWII

STATS & VISUALIZATION

Confirmatory data analysis

- For answering questions rigorously
- Example: is this new drug effective?
- Strong focus on automatic procedures, computation and objectivity
- Looking at data can impair objectivity:
 - Cherry picking, snooping, fishing, data mining

German bombings in London during WWII

STATS & VISUALIZATION

Exploratory data analysis is sometimes compared to **detective work**: it is the process of gathering evidence.

Confirmatory data analysis is comparable to a **court trial**: it is the process of evaluating evidence.

Exploratory analysis and confirmatory analysis “*can—and should—proceed side by side*” (Tukey; 1977).

WHAT ARE STATS?

- A set of tools and methods
- With an old tradition:
 - Origins in demographics
 - Anchored in mathematics & probability theory
 - Visual representations play a role
 - A generally strong focus on (computationally cheap) numerical calculations

WHAT ARE STATS?

Good for:

- Summarizing data for presentation
- Answering questions rigorously
- Making predictions
- Making rational, evidence-based decisions
- A long accumulated experience!

CENTRAL TENDENCY

Name & Meaning	Formula / Example	Used for
Arithmetic Mean [average]	$\frac{\text{sum}}{\text{size}} = \frac{a+b+c}{3}$	Most situations ("average item")
Median [middle value]	Middle of sorted list (2 middles? Average 'em)	Wildly varying samples (houses, incomes)
Mode [most popular]	Most popular value	No compromises (winner takes all)
Geometric Mean [average factor]	$\sqrt[3]{abc}$	Investments, growth, area, volume
Harmonic Mean [average rate]	$\frac{3}{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}}$	Speed, production, cost

CENTRAL TENDENCY

CENTRAL TENDENCY

When are the mean and the median equal? When do they differ?

CENTRAL TENDENCY

negative skew

symmetric

positive skew

CENTRAL TENDENCY

CENTRAL TENDENCY

CENTRAL TENDENCY

(a) Negatively skewed

←
Negative Direction

(b) Normal (no skew)

Perfectly Symmetrical
Distribution

(c) Positively skewed

→
Positive Direction

CENTRAL TENDENCY

What is the best measure of central tendency?

DISPERSION

Standard Deviation

$$\sigma = \sqrt{\frac{1}{N} \sum_{i=1}^N (x_i - \mu)^2}$$

DEPENDENCE

Correlation

POSITIVE CORRELATION

- people who do more revision get higher exam results.

SAMPLING DISTRIBUTION

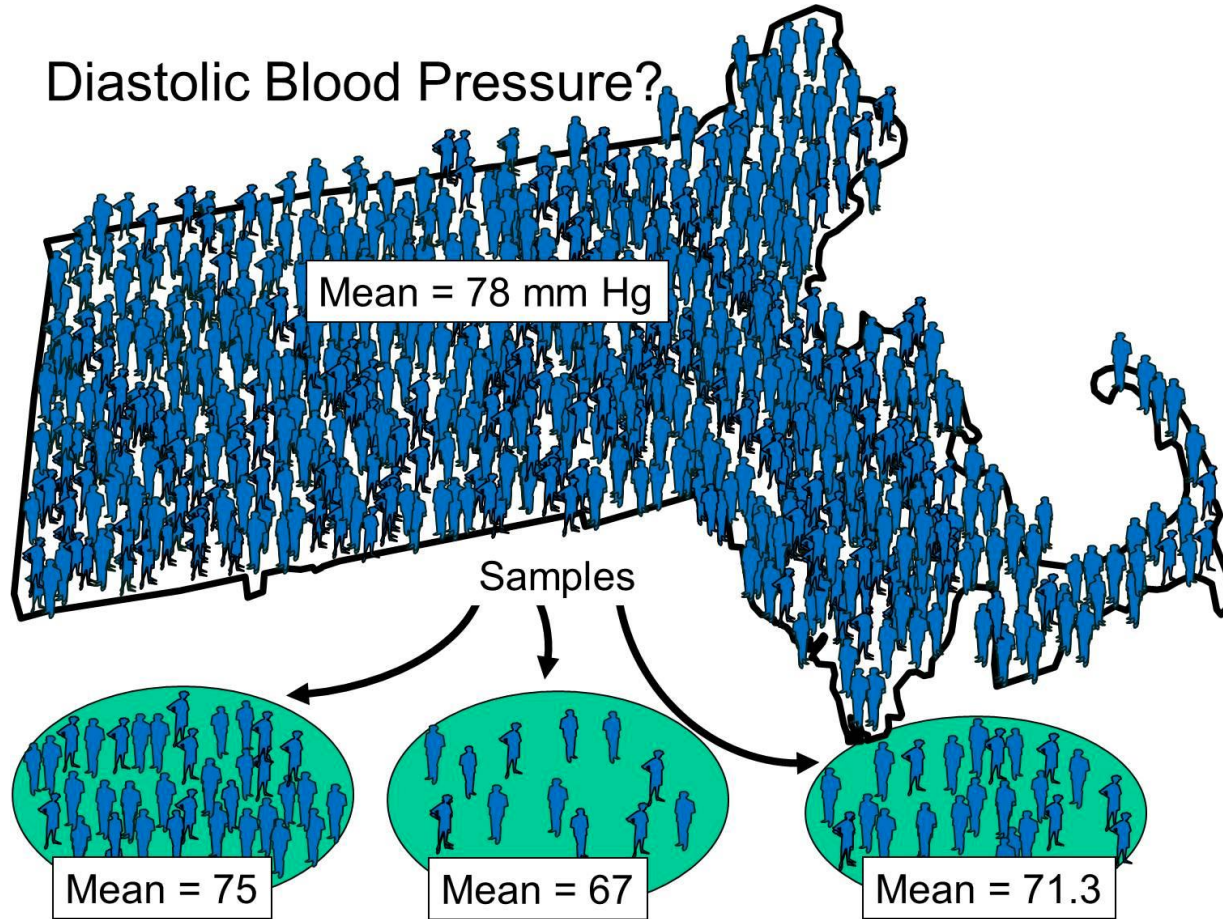

SAMPLING DISTRIBUTION

- Resampling techniques
 - Bootstrapping

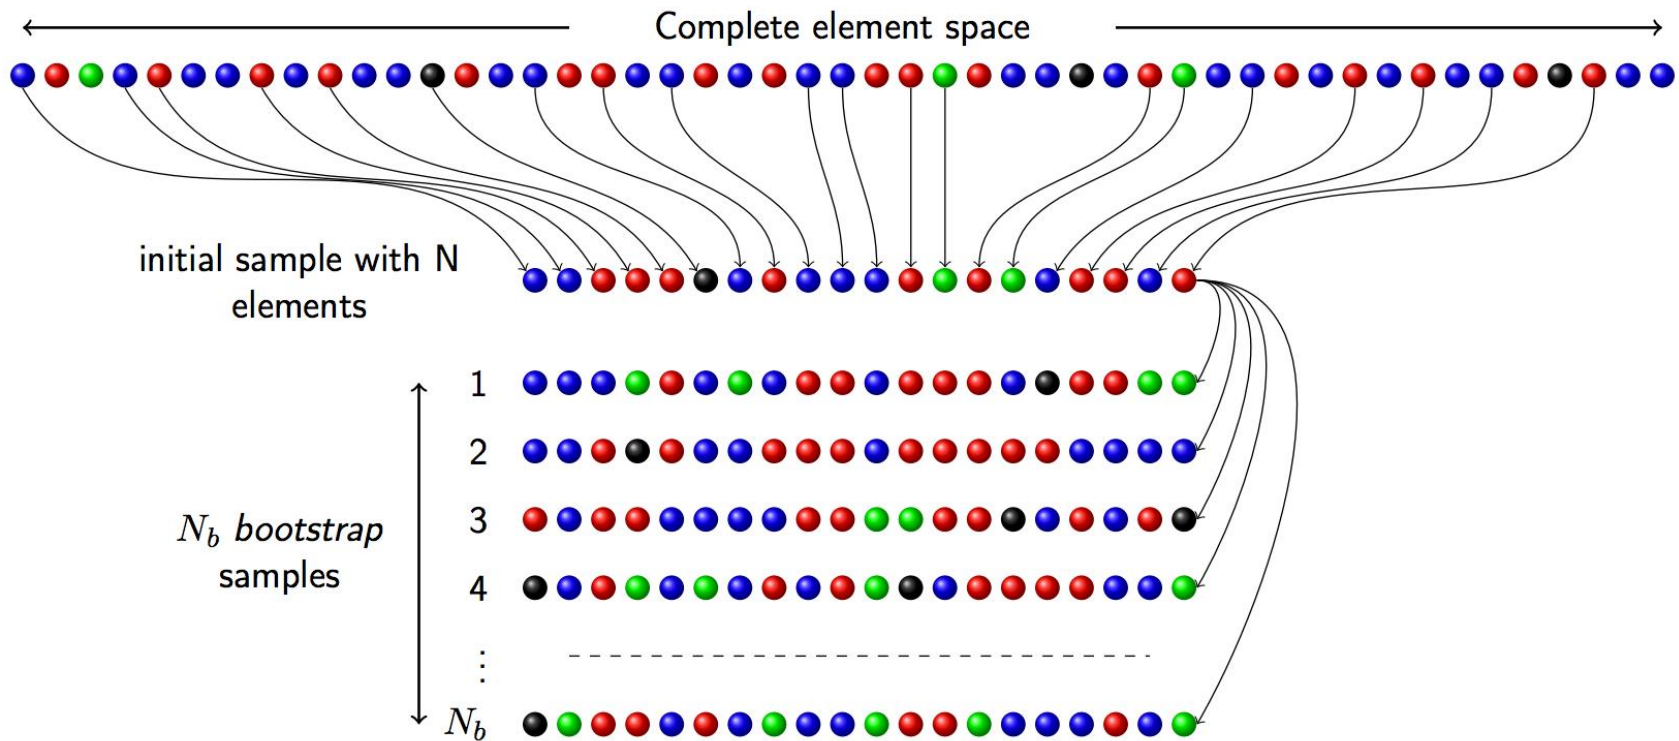

Theorem (B. Efron, Ann. Statist. 1979)

When N tend to infinity, the distribution of average values computed from bootstrap samples is equal to the distribution of average values obtained from ALL samples with N elements which can be constructed from the complete space. Thus the width of the distribution gives an evaluation of the sample quality.

CAST: Effective and Efficient User Interaction for Context-Aware Selection in 3D Particle Clouds

Lingyun Yu, Konstantinos Efsthathiou, Petra Isenberg, and Tobias Isenberg, *Senior Member, IEEE*

Fig. 1. (a) SpaceCast selects particle clusters by enclosing them with a lasso, based on the lasso shape; (b) TraceCast does not require an accurate lasso; and (c) with PointCast users can select tiny clusters from a noisy environment with only a single click or touch.

Abstract—We present a family of three interactive Context-Aware Selection Techniques (CAST) for the analysis of large 3D particle datasets. For these datasets, spatial selection is an essential prerequisite to many other analysis tasks. Traditionally, such interactive target selection has been particularly challenging when the data subsets of interest were implicitly defined in the form of complicated structures of thousands of particles. Our new techniques SpaceCast, TraceCast, and PointCast improve usability and speed of spatial selection in point clouds through novel context-aware algorithms. They are able to infer a user's subtle selection intention from gestural input, can deal with complex situations such as partially occluded point clusters or multiple cluster layers, and can all be fine-tuned after the selection interaction has been completed. Together, they provide an effective and efficient tool set for the fast exploratory analysis of large datasets. In addition to presenting Cast, we report on a formal user study that compares our new techniques not only

PUBLISHED EXAMPLE

Fig. 6. Ratios between mean completion times for the Cast selection techniques. Error bars show 95% confidence intervals.

Thus, overall we have good evidence that both PointCast and TraceCast outperform SpaceCast, and some indication that PointCast may outperform TraceCast. At any rate, the differences among Cast methods are marginal compared to the differences between each Cast method and CloudLasso or CylinderSelection.

Abstract Statistics are tools to help end users accomplish their task. In research, to be qualified as usable, statistical tools should help researchers advance scientific knowledge by supporting and promoting the effective communication of research findings. Yet areas such as human-computer interaction (HCI) have adopted tools — i.e., p -values and dichotomous testing procedures — that have proven to be poor at supporting these tasks. The abusive use of these procedures has been severely criticized in a range of disciplines for several decades, suggesting that tools should be blamed, not end users. This chapter explains in a non-technical manner why it would be beneficial for HCI to switch to an *estimation* approach, i.e., reporting informative charts with effect sizes and interval estimates, and offering nuanced interpretations of our results. Advice is offered on how to communicate our empirical results in a clear, accurate, and transparent way without using any tests or p -values.

1 Introduction

A common analogy for statistics is the toolbox. As it turns out, researchers in human-computer interaction (HCI) study computer tools. A fairly uncontroversial position among them is that tools should be targeted at end users, and that we should

Bad Stats: Not What It Seems

Towards a Statistical Reform in HCI and Visualization

[Pierre Dragicevic](#) and colleagues

This page provides arguments and reading material to explain why it would be beneficial for human-computer interaction (HCI) and information visualization (infovis) to stop doing mindless null hypothesis significance testing (NHST) and start reporting informative charts with effect sizes and interval estimates, as well as offering more nuanced interpretations of our results. Our scientific standards can also be greatly improved by planning analyses and sharing experimental material online.
